

Team 02 "Team One" - Project Summary

- **Technology Stack:** Python and Flask
- **Driver Accounts:** Dropped drivers transition to an inactive state rather than being deleted. Drivers are strictly prohibited from attempting to drive for a second sponsor company while affiliated with one.
- **Driver Points:** Policies regarding what happens to points when a driver is dropped (e.g., frozen, deleted, or retained) will be decided later and can be customized.
- **Point & Score Rules:** Point calculation based on driving scores can be defined as part of the system (such as driver self-reporting or sponsor-designed scoring rules).
- **Alert Mechanism:** Driver alerts can be implemented via email, SMS, or in-app notifications, providing choice for the driver.
- **Security & Accounts:** The team will define custom password complexity rules. When an admin creates a new driver or sponsor user, the system forces them to reset their password upon first login. Admins have permission to deactivate accounts.
- **Product Catalog & Inventory:** For external product API stock checks, the system assumes an item is in stock if reported as available, and out of stock if reported as unavailable at checkout.
